

Index to Broadcasting Stations by Wavelength or Frequency.

Frequently a station is picked up but the call sign cannot be deciphered or heard. If the wave-length or frequency is known the station's call-sign may be found by referring to the following list. The nationalities of the stations listed will be understood by comparing the first letter of the call sign with the list of International Prefixes. Example: ZL—New Zealand; VK—Australia; W—U.S.A.; K—U.S.A. and Hawaii; J—Japan, etc.

Some Helpful Data—Continued.

across the combination divided by the number of condensers connected in series, provided the insulation resistances or power factors of the condensers are equal. When the insulation resistances are not the same for each condenser, the voltage distribution across the condenser will be affected to a greater or lesser extent depending on the waveform of the applied voltage. The effect of unequal voltage distribution can be minimized by the use of resistor balances (high value resistors across the condensers).

The voltage distribution among several condensers connected in series, for condensers of fairly low power factor, will be proportional to the product of capacity by power factor.

Equivalent Series Resistance of Shunt Resistance Across a Condenser.

The effect of a high value of resistance connected across a condenser may be resolved into the effect of a resistance connected in series with the condenser by means of the following equation in which "r" is the shunt resistance and "R" is the equivalent series resistance. The equation holds true only for condensers of very low power factor.

1

$$R = \frac{1}{(6.28f)^2 \times C^2 \times r}$$

(With acknowledgments to "DX")
